

The Dictionary

The category exists, so the sole deep open link can finally be stated in it. BT1a — the dictionary-plus-recovery theorem between the obstruction datum of causal descent and the Hankel structure of the quotient — is retyped as a morphism of sheaves on the budget lattice and attacked clause by clause: local failure is row conflict, compatibility is the shift-consistent completion, effectivity is the enrichment's own wall, resource is rank, magnitude is the singular tail, and the whole is natural under the cost algebra's grading. The recovery is audited on six hundred presentations, the Amin Abae quantum rank law is recovered exactly, and RockSample's measured compression break is typed from the quantizer's own transition graph.
