

The Three Closures, and the Escape, Re-Adjudicated

The continuum Fisher–Rao/Leray upgrade, the off-class nc-AAK package, and the rank-aware synthesis are consolidated into the unification — the ledger stands at two links. And the escape, quantified as ordered: the shadow itself moves (the symmetric basin sits $5.64e-7$ below the scans' optimum), the $5.73e-7$ refutation decomposes into the abelian basin hop plus a certified residual of $8.2e-9$, and H_2 's curvature at the re-located shadow — the positive pure curvatures, the mixed checkerboard, no infinitesimal escape — is read by the degenerate second-order law.
