

The Reversal Group and the Abelian Shadow

The reflection-laundering theorem beyond the ring: the reversal group $\hat{G} = \text{Aut} \cup R$ with its index-two coset structure and computable criterion; the twist normal form that manufactures non-circulant self-converse witnesses at will; the exact dimension table that makes the reflection mechanism measure zero; the laundering stratification (reflection / strong lumping / residual) with the sharp converse refuted; and the binary resolution floor — the 2-block and 3-block laws of every stationary binary process are symmetric by identity, and the first binary arrow is the 4-block. Then the cell's ~~And in Abac:~~ the abelian-shadow sandwich, the exact free-cell machinery, the empty escape room, and the line-atom reduction of the whole problem to a two-parameter cubic stationarity system — Independent Researcher, Tehran · ORCID 0000-0002-0019-1842 $D(2) = 1.2771421129$, an exact algebraic point.
