

The Remaining Open Links

Three links were left open at the close of Volume IV, and this volume attacks them in the order fixed: BT3's enrichment construction is built — the cost-enriched graded category of interfaces, with its affine cost algebra, budget filtration, decoration endomorphism, and guarded trace; BT2's equality is closed as far as the corpus's own conditional floor allows — the graded small-gain law, with the in-span gap now an exact quadratic closed form; and Risk 3 is confronted on RockSample with the theory's instruments against the named POMDP baseline. One law gathers **Amin Abae** ~~in a~~ session: the budget dichotomy at $L = 1$, where the intercept's non-existence and the contraction's existence are the two signs of $\ln L$, and the ceiling is a first-order pole at the wall.
